A Sample Trucking Company Business Plan for Canada

This **trucking business plan sample** follows a complete ten-section plan for Maple Meridian Freight Inc., a fictional Canadian carrier. Use the annotated structure to organize your own research and lender discussions.

SAMPLE ONLY: all company details, financials, market-sizing inputs and operating assumptions are illustrative. No revenue, profit, financing or compliance outcome is promised.

How to use this sample

Read each sample section and its annotation, then replace the fictional assumptions with dated quotes, actual customer evidence and route-specific compliance checks. Do not submit the sample as your company's plan. The tables demonstrate consistency across a funding request, income statement, cash flow and balance sheet.

1. Sample executive summary

Maple Meridian Freight Inc. is a fictional Ontario trucking company presented solely as a SAMPLE. It proposes an owner-managed dry-van carrier based at a leased yard in Mississauga, serving Ontario and Quebec through scheduled regional less-than-truckload (LTL) runs and selected long-haul truckload lanes. The launch fleet consists of two used highway tractors and two dry-van trailers. Cross-border Canada–US service is a later operating option, conditional on approvals, insurance, customer commitments and a separate lane-level cost review. No US revenue is included in the base case.

The proposed customers are manufacturers, packaging distributors and wholesalers that need dependable appointments, shipment visibility and documented delivery. The company will sell defined lanes and handling standards rather than promise the lowest spot rate. Regional LTL combines compatible pallet shipments; long-haul work is accepted only when appointment timing, return loads and legal driver availability support the trip. Freight requiring refrigeration, dangerous-goods capability or specialist handling is excluded at launch.

Illustrative funding: the plan requests a $200,000 equipment term loan alongside $100,000 owner equity. The resulting $300,000 launch budget allocates $220,000 to equipment, $20,000 to setup expenses and $60,000 to opening cash. Illustrative revenue is $600,000, $682,500 and $748,000 across the first three full operating years. These are teaching assumptions, not market rates, customer commitments or an earnings forecast. Fuel, payroll, insurance, maintenance, customer payment delays and debt service are all modelled explicitly.

Launch depends on acceptable equipment inspections, binding insurance, the required carrier registrations, a compliant safety system and sufficient cash after all deposits. Management will defer dispatch if any of these conditions remains unmet. The repayment case rests on collected freight revenue after operating costs; equipment resale value is a secondary consideration. A real application would attach written quotes, owner experience and a monthly forecast before seeking credit.

> *The summary should reconcile the business model, funding request and financial statements. A fictional sample cannot establish demand, creditworthiness or regulatory readiness.*

2. Sample company overview

Maple Meridian is structured in this example as an Ontario corporation, owned entirely by its working founder. The owner provides equity before the first equipment payment and signs off on bank reconciliations, dispatch controls and customer credit limits. Incorporation, tax registration and carrier authority are separate tasks: registering a business name does not authorize commercial trucking. The company will confirm its obligations with Ontario and the authorities governing each operating jurisdiction.

The proposed yard provides secure parking and access for inspections without operating a public freight terminal. The lease must permit heavy commercial vehicles and the planned hours of access. Regional freight transfers will use contracted warehouse services when required; the plan does not assume that a parking yard may lawfully be used for unrestricted cross-docking. Written arrangements will allocate custody, cargo claims, security and loading responsibilities.

The founder's fictional background is highway driving and dispatch supervision. In a real plan, employment records, licence history, safety performance and references would replace that description. The owner is paid through the payroll budget for driving and management work. Profit retained by the corporation is separate from salary, and neither is a promise of personal take-home income.

The company will maintain a CRA business number and appropriate program accounts. Under CRA freight transportation guidance, GST/HST treatment will be checked by shipment and customer circumstances: some qualifying freight transportation may be zero-rated, while domestic taxable services can require tax collection. The financial tables exclude recoverable GST/HST from revenue and expenses. Actual tax collections, input tax credits, filing dates and refunds must appear separately in the monthly cash forecast.

> *State the legal entity, ownership, premises and tax treatment clearly. Attach evidence for experience and permissions instead of presenting a sample biography as fact.*

3. Sample services: long-haul and regional LTL

The long-haul offer is scheduled dry-van transport for full or near-full trailer loads on approved Canadian lanes. A quotation specifies origin, destination, equipment, transit window, declared cargo characteristics and accessorial charges. Dispatch checks empty repositioning, return opportunities, weather and customer unloading times

before accepting a load. A high outbound invoice may still produce a weak round-trip contribution when the tractor returns empty.

Regional LTL serves compatible pallet freight within an initially narrow Ontario service area, with Quebec moves booked only when routing and capacity allow. Quotations account for pallet positions, weight, dimensions, handling needs, appointments and the number of stops. LTL is not priced as though every pallet receives a dedicated truck. Dispatch builds a route manifest and loading sequence that protect cargo and avoid unnecessary rehandling. Tailgate, residential and inside-delivery work require explicit capability and pricing approval.

For both services, the customer receives a written rate confirmation, shipment tracking updates and proof of delivery. Detention, redelivery, cancellation and storage terms are agreed before collection. Fuel surcharges are identified separately in the quotation and invoice, with a defined reference and adjustment method; the company will not assume every fuel increase is recoverable. The illustrative revenue-per-mile measure below includes all freight and surcharge revenue divided by all fleet miles, including empty miles.

Claims handling requires photographs where appropriate, signed shipment records and timely escalation to the insurer. Customer agreements must address liability and exclusions without promising coverage the insurance policy does not provide. The company will refuse freight outside its operating authority, insurance terms or safe loading capacity. Any future US service, refrigerated freight or dangerous-goods service requires a revised operating and financial plan before sale.

> *Explain the service boundaries and pricing unit. Invoice revenue, loaded-mile rates and revenue per total fleet mile measure different things and should never be interchanged.*

4. Sample market analysis: TAM, SAM and SOM

The sample begins with a customer hypothesis rather than an unsupported claim about Canada's freight market size. Potential buyers are Ontario manufacturers and distributors shipping repeat dry-van freight to established commercial receiving locations. Research would identify individual facilities, shipping contacts, lane frequency, average shipment characteristics, incumbent carriers and procurement requirements. Interviews should distinguish a request for a quote from an actual commitment to tender freight.

The business plan glossary defines the market-sizing terms; the TAM, SAM and SOM worked guide helps separate total demand from realistically obtainable work. Here, all market-sizing numbers are illustrative. Assume a mapped universe of 1,000 relevant shippers spending $100,000 annually on suitable freight: TAM is $100 million. Filtering to 200 accounts within the proposed lanes, cargo limits and service capabilities gives an illustrative SAM of $20 million. These are invented planning inputs, not Statistics Canada estimates.

The illustrative first-year SOM is $600,000, or 3% of that fictional SAM. It is constrained by two trucks and 200,000 total fleet miles at $3.00 revenue per total mile, not by an arbitrary national market share. Management would validate that capacity against weekly legal schedules, maintenance downtime, delivery windows and route density. A sales target that requires simultaneous use of the same truck on different lanes must be reduced.

The competitor review will compare local carriers, larger networks, brokers and owner-operators on lanes, service commitments, minimum charges, tracking and claims procedures. No competitor rate is asserted in this sample. Real research should retain dated public quotations where available and ethically obtained customer feedback, without treating an advertised rate as a firm contract. The company aims to win business through reliable communication, fit with receiving schedules and accurate paperwork.

Risk factors include concentration in one shipper, unpaid invoices, fuel movements, repairs, weather disruption and weak backhaul demand. Management will set customer credit limits and review contribution by lane before

extending the service area. The trucking business plans industry guide provides the wider planning checklist; this sample shows how the resulting evidence fits into a complete document.

> *Market size supports context; a named customer pipeline and feasible truck schedule support the sales case. Replace every fictional TAM input before using the plan externally.*

5. Sample operations, fleet and Canadian compliance

The launch fleet comprises two used tractors and two dry-van trailers acquired only after independent mechanical inspections and confirmation of financing conditions. Each asset has a maintenance file, inspection schedule, defect reporting procedure and repair authorization process. Dispatch cannot override a safety-related out-of-service decision. A contracted maintenance provider will cover scheduled servicing and emergency repair arrangements; its availability and rates need written confirmation.

Ontario's Commercial Vehicle Operator's Registration (CVOR) framework monitors applicable commercial operators through safety-related records. Maple Meridian will confirm registration requirements, obtain the appropriate certificate before operating and monitor its carrier record. Driver qualifications, vehicle inspections, preventive maintenance, cargo securement and collision procedures form part of the safety program. CVOR is an Ontario operator system; it is not a substitute for a driver's licence or US operating authority.

Dispatch will follow the applicable Ontario hours-of-service requirements, together with federal rules where the operation falls under federal jurisdiction. The safety lead determines which regime applies to intraprovincial, interprovincial and international work. Trip planning includes driving, on-duty and off-duty limits, cycles, rest, loading delays and adverse conditions. The company will not use a revenue target as permission to exceed legal hours or to pressure a fatigued driver.

Following Ontario ELD guidance, where electronic logging devices are required, the fleet will use devices meeting the applicable certification and regulatory requirements, with driver training, malfunction procedures and record retention. Transport Canada's ELD guidance is the starting reference for federal requirements. A device purchase alone does not create compliance: the safety lead must review unassigned driving, edits, supporting documents and exceptions. Dispatch receives an available-hours check before confirming appointments.

Interjurisdictional operation also requires review of apportioned registration and fuel-tax obligations. Under Ontario's International Fuel Tax Agreement guidance, qualifying operators must determine registration, reporting and recordkeeping duties. The company will retain distance by jurisdiction, fuel purchase records and supporting trip data, then reconcile returns with vehicle activity. IFTA settles fuel-tax obligations; it does not replace fuel purchases or remove the need to budget tax cash flows.

Canada–US expansion remains outside the base forecast. Before accepting a US load, management will confirm applicable USDOT registration, FMCSA authority, insurance filings, customs and border processes, driver admissibility, cabotage restrictions and US safety obligations. FMCSA registration guidance and a qualified customs adviser will inform that review. Commercial cargo requirements and driver immigration permissions are distinct. Currency conversion, border delays, US tolls and return-load restrictions require their own stress test.

The daily workflow runs from customer credit approval to load acceptance, vehicle and driver assignment, pickup checks, exception monitoring, signed delivery and invoicing. A missed appointment triggers proactive customer communication. Winter planning includes weather monitoring, safe parking options and schedule buffers. The owner reviews maintenance downtime, empty miles, detention, claims and overdue invoices weekly. The objective is safe, financially supportable utilization rather than maximum movement at any cost.

> *Document who checks each obligation and retain evidence. Regulatory applicability depends on vehicle, route and operating model; official guidance must be checked again before launch.*

6. Sample marketing and sales plan

The founder will build a prospect list around a limited number of repeat lanes and commercial shipping clusters. Initial outreach offers a discovery conversation about shipping patterns, appointment difficulties and documentation needs. A professional website will describe actual service areas, cargo exclusions and contact procedures. Marketing will avoid claims about guaranteed transit, capacity or cross-border service before the company can lawfully and consistently deliver them.

Prospects move through qualification, lane costing, insurance and credit review, trial shipments and repeat bookings. The sales record distinguishes a conversation, a quoted opportunity, a trial shipment and a signed agreement. No speculative pipeline is booked as contracted revenue. Each quote is checked against fuel assumptions, loaded and empty distance, driver time, handling and a contribution threshold before it is issued.

Broker relationships may help fill suitable capacity, but they do not remove counterparty or margin risk. The company will verify the contracting party, payment terms and shipment instructions. It will avoid dependency on one broker or shipper by monitoring revenue concentration and receivables. Customer retention will focus on accurate pickup windows, visible exception handling, clean invoices and timely claims communication.

The owner reviews quote conversion, repeat bookings, contribution by customer and collection time monthly. Marketing spending is included within overhead in the illustrative forecast. If the pipeline cannot support the operating schedule, management will revise mileage and cash assumptions before committing to further equipment. Readers building their own first draft can use the business plan generator, then replace its assumptions with verified customer and supplier evidence.

> *A sales process should connect reachable accounts to available capacity and collected cash. Treat trial work as evidence to investigate, not proof that future loads are assured.*

7. Sample management and organization

The working founder is accountable for finance, customer relationships and dispatch oversight, and drives within the legal schedule. A second employed driver operates the other tractor. A designated safety lead reviews driver files, logs, maintenance records and corrective actions; outsourcing some reviews does not transfer the operator's legal responsibilities. The sample does not assume the founder can drive continuously while also covering every administrative task.

The combined payroll budget includes owner compensation, the second driver and payroll-related costs. Illustrative owner gross salary is $60,000, $65,000 and $70,000 in the three forecast years, already included in total payroll rather than deducted again from profit. Actual payroll would require support from employment terms, remittances and applicable employment and workplace-insurance obligations. Contractor classification must follow the real relationship, not a label selected to reduce costs.

A bookkeeper reconciles bank, fuel-card and customer accounts, while an accountant reviews tax filings and year-end statements. Management approves payments and new vendors with documented controls. Backup arrangements cover driver absence, equipment downtime and urgent customer communication. Any replacement driver must meet licence, experience, insurer and training requirements before dispatch.

Monthly management reporting combines safety exceptions with cash and operating measures. The owner investigates unpaid invoices, falling contribution, repeated defects and customer complaints before approving growth. A real lender package should include the founder's résumé, personal financial information where requested, professional advisers and a clear statement of who has authority to stop unsafe or uneconomic work.

> *Allocate enough management time and replacement coverage. Owner salary compensates labour; dividends and retained profit are separate decisions constrained by cash and solvency.*

8. Sample financial projections: illustrative only

Every financial amount, operating input, percentage and scenario in this sample is illustrative, expressed in Canadian dollars unless stated. None represents a current freight rate, diesel quote, insurance premium, tax opinion or promised return. Year 1 is the first full operating year after setup. The same two tractors operate throughout the forecast; the higher mileage and revenue per mile are assumptions requiring customer and scheduling evidence.

Revenue equals total miles multiplied by blended revenue per total mile. Diesel equals miles multiplied by litres per mile and budgeted price per litre. Maintenance is a mileage allowance, while insurance is a fixed annual assumption requiring a binding quote. The diesel budget is deliberately a model input rather than an asserted Canadian pump price. Metric trip records should be converted consistently if billing or reporting uses kilometres.

Illustrative driver	Year 1	Year 2	Year 3
Fleet tractors / trailers	2 / 2	2 / 2	2 / 2
Total fleet miles	200,000	210,000	220,000
Revenue per total mile	$3.00	$3.25	$3.40
Diesel litres per total mile	0.60	0.60	0.60
Diesel budget per litre, net of recoverable tax	$1.50	$1.50	$1.50
Fuel cost per total mile	$0.90	$0.90	$0.90
Maintenance per total mile	$0.20	$0.21	$0.22

Illustrative operating assumptions only; CAD unless stated. All miles include empty running.

Illustrative amount	Year 1	Year 2	Year 3
Revenue	600,000	682,500	748,000
Diesel fuel	180,000	189,000	198,000

Illustrative amount	Year 1	Year 2	Year 3
Payroll incl. working owner and employer costs	160,000	170,000	180,000
Insurance	36,000	38,000	40,000
Maintenance and repairs	40,000	44,100	48,400
Yard, permits, tolls, systems and administration	54,000	57,000	60,000
EBITDA	130,000	184,400	221,600
Depreciation	30,000	30,000	30,000
Interest	16,000	12,800	9,600
Profit before illustrative tax	84,000	141,600	182,000
Tax provision (illustrative 15%)	12,600	21,240	27,300
Net income	71,400	120,360	154,700

Illustrative three-year pro-forma income statement — CAD; no earnings promise.

The model assumes a $200,000 loan with annual principal repayments of $40,000 and illustrative interest of 8% on each year's opening principal. This simplified schedule is not a lender quotation: monthly payments, fees and actual amortization will differ. Depreciation is a book expense, not tax capital cost allowance. The illustrative tax provision is paid in the same year and does not establish the company's applicable tax rate or eligibility for a deduction.

Illustrative amount	Year 1	Year 2	Year 3
Opening cash	60,000	96,400	172,660
Net income	71,400	120,360	154,700
Add depreciation	30,000	30,000	30,000
Increase in net operating working capital	(25,000)	(14,100)	(13,800)
Operating cash flow	76,400	136,260	170,900
Capital spending	0	(20,000)	(20,000)
Loan principal repayments	(40,000)	(40,000)	(40,000)

Illustrative amount	Year 1	Year 2	Year 3
Closing cash	96,400	172,660	283,560

Illustrative three-year cash flow — CAD; annual summary, not a substitute for a monthly schedule.

Illustrative amount	Year 1	Year 2	Year 3
Cash	96,400	172,660	283,560
Accounts receivable	50,000	65,000	80,000
Net equipment	190,000	180,000	170,000
Total assets	336,400	417,660	533,560
Operating accounts payable	25,000	25,900	27,100
Equipment loan outstanding	160,000	120,000	80,000
Total liabilities	185,000	145,900	107,100
Equity incl. retained income	151,400	271,760	426,460
Liabilities plus equity	336,400	417,660	533,560

Illustrative year-end balance sheets — CAD. Opening equity is $80,000 after $20,000 prelaunch expenses.

Opening cash is the $60,000 reserve remaining after equipment purchases and setup expenses. Opening equipment is $220,000; opening debt is $200,000; owner cash invested is $100,000. Expensing $20,000 before Year 1 leaves $80,000 opening book equity. Receivables and payables begin at zero. Subsequent capital spending is paid in cash, no dividends are assumed and net income accumulates in equity. These conventions explain why sources of funding and opening book equity differ.

The actual monthly workbook must show invoice dates, payment delays, fuel-card settlement, payroll, tax remittances and debt payments. Annual positive cash does not prevent a midyear shortage. Recoverable GST/HST and IFTA balances are omitted from this simplified annual example but must be explicitly scheduled for a real business. Receivable balances exclude sales tax; delays in tax refunds or customer payment would consume reserve cash.

Illustrative sensitivity tests make the risk visible. At Year 1 fuel consumption, a $0.20-per-litre diesel increase adds $24,000 in annual expense before any surcharge recovery. A $0.25 decline in revenue per total mile reduces annual revenue by $50,000 at unchanged mileage. If both occur, illustrative pretax profit falls from $84,000 to $10,000 before any further operating changes. A further $25,000 delay in customer collections reduces cash by that amount without changing recognized profit.

Management should also test a major repair, uninsured deductible, a lost customer and several weeks of downtime. Costs cannot all be assumed to fall when mileage falls: insurance, debt and some payroll continue.

The response may require reducing discretionary spending, limiting new customer credit, negotiating collections or deferring expansion. Additional borrowing is not an automatic solution and is not included as an unexplained balancing figure. For a model based on actual quotes, see our business plan writing services.

> *Check that each balance sheet balances, cash rolls forward and principal repayments reduce debt. Reconcile owner pay, taxes and capital spending rather than treating EBITDA as spendable cash.*

9. Sample funding request

Maple Meridian requests an illustrative $200,000 term loan toward the $220,000 equipment purchase, supported by $100,000 owner cash. The owner contribution covers the remaining equipment price, setup expenses and reserve. The sample does not include an approved revolving facility or assume a lender will finance all startup cash. Equipment security, guarantees, down payment and repayment terms remain subject to lender assessment.

Illustrative use	Amount
Two used tractors	160,000
Two used dry-van trailers	60,000
Prelaunch insurance, registrations, training and setup expenses	20,000
Opening working-capital cash reserve	60,000
Total uses	300,000
Owner cash equity	100,000
Requested equipment term loan	200,000
Total sources	300,000

Illustrative startup uses and funding sources — CAD.

A first truck may be eligible equipment under the Canada Small Business Financing Program (CSBFP), subject to current borrower, asset, expenditure and program requirements. CSBFP is delivered through participating lenders, which make the credit decision; it is not a grant or an approval guarantee. Confirm eligible purchase costs, timing, prior commitments and documentation with the lender before paying a non-refundable deposit. This sample does not state that its entire funding request qualifies.

The owner will compare conventional equipment financing, leasing and any suitable program-backed option on total cost, security, residual obligations and cash flow. The final lender package should show equipment quotes, appraisal or inspection evidence where requested, proof of equity, insurance terms, customer evidence and a monthly repayment forecast. A personal guarantee or security interest has consequences beyond the example and should be reviewed before signing.

Funds will be released against the agreed acquisition and launch milestones. The company will not use equipment financing proceeds as though they were unrestricted working capital. If quotes exceed the budget, the owner must revise the sources-and-uses schedule and liquidity test before purchase. The decision to proceed depends on financeable terms and operating readiness rather than on the sample's projected profit.

> *The funding table must equal the opening asset and cash position after setup expenses. Separate equipment eligibility from lender approval and from working-capital availability.*

10. Sample appendix and template checklist

A completed appendix should contain dated equipment quotations, inspection reports, maintenance arrangements, yard lease permissions and insurance terms. Include the required carrier registrations, a compliance responsibility matrix, driver qualification and training procedures, ELD arrangements and emergency contacts. Keep personal identity records and commercially sensitive documents in a controlled lender package rather than publishing them on a website.

The market evidence file should retain shipper interviews, lane maps, competitor observations, written customer terms and the distinction between contracts and expressions of interest. The financial file should contain monthly income, balance-sheet and cash-flow schedules, debt amortization, fuel and mileage calculations, GST/HST treatment, IFTA support and downside cases. Each material input needs a source, date and owner responsible for updating it.

Before sharing a real plan, confirm that the ten sections describe the same fleet, staff, customers and financing. Test whether the available legal driver hours support the route plan; whether all equipment, tax and insurance cash payments appear; and whether a slower collection cycle leaves enough liquidity. Replace the fictional company and every illustrative figure with your own evidence. There are no unfinished fields in this teaching example, but it is not a submission-ready application for any actual carrier.

The existing painting and welding sample templates do not provide a downloadable full-plan PDF or PDF export control. This trucking page follows that HTML format. The separate trucking PDF in the site's template library is a generic template, not a PDF version of Maple Meridian's sample plan. Readers can refer to the Learning Centre and industry business plan hub for related planning resources.

> *An appendix is an evidence index. A real lender version should attach the supporting documents; this public fictional sample explains the evidence needed without inventing licences or customer commitments.*

Trucking business plan FAQs

How much does it cost to start a trucking company in Canada?

There is no single reliable startup price: equipment age, financing, insurance, lanes and cash reserve change the budget. This two-tractor, two-trailer sample uses an illustrative $300,000 total, including $220,000 equipment, $20,000 setup expenses and $60,000 opening cash. These are invented teaching amounts, not Canadian market price ranges. Obtain current written quotes and include deposits, taxes, repairs and the collection gap before deciding what you need.

What is CVOR in Ontario?

CVOR means Commercial Vehicle Operator's Registration. Ontario uses it to monitor applicable commercial operators and their safety performance. Operators must determine whether they need a certificate and meet the associated obligations for drivers, vehicles and records. A CVOR certificate does not replace driver licensing, insurance, hours-of-service compliance or permissions required outside Ontario.

How much do owner-operators make in Canada?

Gross freight billings, operating profit and personal take-home pay are different. No universal earnings range is asserted here without a suitable source. Build your own downside-to-base range after fuel, truck payments, insurance, maintenance, empty miles, tax and unpaid time. The illustrative combined $74,000 fuel-and-rate downside leaves $10,000 corporate pretax profit versus $84,000 in the base case, after the sample owner's $60,000 gross salary. Those are scenario endpoints, not typical Canadian earnings or promises; actual losses are possible.

Can I finance my first truck through CSBFP?

A truck may qualify as eligible equipment under CSBFP if the borrower, purchase and use meet current program requirements. Participating lenders assess credit and make lending decisions. Confirm eligibility, timing, eligible costs, required equity and documents before committing to a purchase. CSBFP is not a grant, and neither eligibility nor a business plan guarantees approval.

What should a trucking business plan include?

Include an executive summary, company overview, services, market analysis, operations, marketing, management, financial projections, funding request and appendix. A Canadian carrier should also explain fleet capacity, empty miles, fuel and surcharge assumptions, maintenance, insurance, driver hours, applicable CVOR and ELD duties, IFTA, GST/HST and any cross-border approvals. Support the financial model with current evidence and downside tests.

Official sources and verification notes

These named authorities support the regulatory and financing guidance, not the invented financial assumptions. Confirm current applicability before operating or applying. No external freight-rate, diesel-price or income statistics are used.
